NATURALLY BETTER LANDSCAPING FOR HOAS

COMMUNITY PLANTING CONCEPT

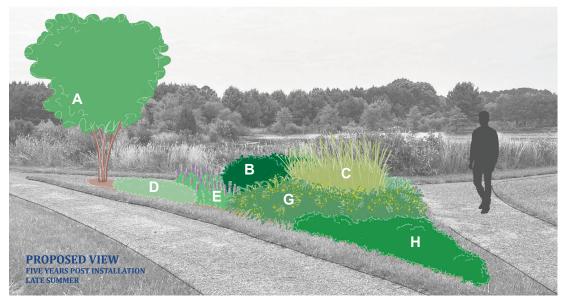

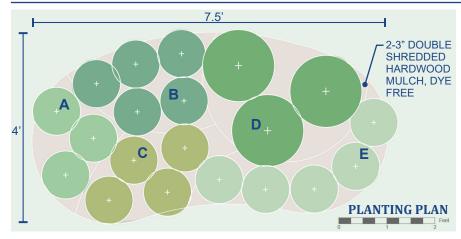

Native plants have evolved and adapted to our local conditions over the years, resulting in many benefits that include creating vital habitat for pollinators to feed and reproduce, and requiring less water, fertilizer, and maintenance.

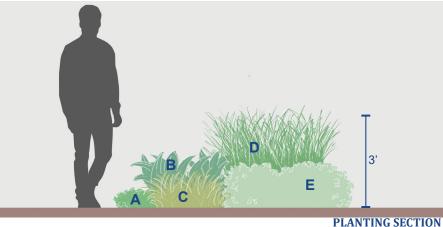

These specific plants have been chosen to generate year-round interest in the form of flowers, fruit, texture, or foliage. They will remain relatively compact to reduce the need for frequent pruning. All of the proposed plants are perennial and will either retain their form all year long or will return year after year.

NATURALLY BETTER LANDSCAPING FOR HOAS RESIDENTIAL POLLINATOR GARDEN PLANTING CONCEPT

Create your own personal pollinator garden using native plants!

This garden has been designed for a shady to partially shady site that tends to stay wet. Always choose plants that thrive in the existing light and moisture conditions available.

Four Seasons of Interest

At least one plant within this garden will be in bloom at any given time between May through October.

In winter, the grasses and evergreen fern provide texture and movement, and over-wintering birds will visit this garden to eat the seeds.

Right Plant Right Place

When choosing plants, it is important to consider their natural form at full maturity. Select plants that will not grow taller or wider than you want them to. This eliminates the need for pruning and allows the plant to achieve its beautiful natural

This pollinator garden has been designed for a homeowners front or back yard. Plants selected will remain compact to maintain a tidy appearance, keep views open, and minimize maintenance.

Recommended Maintenance

Watering

During the first two years, your garden will need watering every two to three days unless there is significant rainfall. This initial watering will help your plants establish strong, robust root systems. After the first two years, watering can be reduced to an as needed basis during periods of extended drought.

Weeding

Be sure to pull any weeds that sprout in the bed. Once the plants have grown to their full size, they will crowd out most weeds and reduce the need for yearly mulch applications.

Spring Clean-up

Wait to cut your plants back until mid-late April and leave a 12" tall stub behind. Beneficial insects lay their eggs in the stems of dried plant material and need time to hatch in spring.

RESIDENTIAL POLLINATOR GARDEN PLANTING CONCEPT

PLANTING SECTION

Create your own personal pollinator garden using native plants!

This garden was designed for a site that receives full sun. Always choose plants that thrive in the amount of light available.

Four Seasons of Interest

At least one plant within this garden will be in bloom at any given time between May through October.

In winter, the grasses provide texture and movement, and over-wintering birds will visit this garden to eat the seeds.

Right Plant Right Place

In accordance with HOA guidelines, none of the selected plans grow taller than four feet.

When choosing plants, it is important to consider their natural form at full maturity. Select plants that will not grow taller or wider than you want them to. This eliminates the need for pruning and allows the plant to achieve its beautiful natural form.

Recommended Maintenance

Watering

During the first two years, your garden will need watering every two to three days unless there is significant rainfall. This initial watering will help your plants establish strong, robust root systems

Weeding

Be sure to pull any weeds that sprout in the bed. Once the plants have grown to their full size, they will crowd out most weeds!

Spring Clean-up

Wait to cut your plants back until mid-late April and leave a 12" tall stub behind. Beneficial insects lay their eggs in the stems of dried plant material and need time to hatch in spring.
